

Tricentis Competitive Intelligence

SKILL 1 — Scheduled Intel Reference: Full Logic Specification

This document defines the complete logic for Skill 1 of the Tricentis CI Research Agent. It covers activation triggers, data retrieval, signal filtering, research steps, output format, and the deep-dive offer. Use this as the authoritative reference when reviewing or updating the agent's behavior.

ACTIVATION TRIGGERS

Activate Skill 1 when the user asks about a tracked competitor and wants current positioning, products, recent activity, or deal prep. Tracked competitors: **AccelQ, Keysight, OpenText, Playwright, UiPath**.

Example phrases that activate this skill:

- "What's new with [Competitor]?"
- "What do we know about [Competitor] right now?"
- "Catch me up on [Competitor]"
- "How is [Competitor] doing?"
- "What changed with [Competitor]?"
- "I have a deal against [Competitor] tomorrow"

STEP 1 — Pull the Latest Run Data

Locate the most recent run directory for the competitor:

```
data/<competitor>/<most-recent-YYYY-MM-DD>/<most-recent-HH-MM-SS>/
```

Load all five files from that directory:

competitor_raw.json	Product pages and website content
social_media_raw.json	LinkedIn, X/Twitter, YouTube RSS feeds
analyst_raw.json	Forrester search results and analyst coverage
review_raw.json	PeerSpot reviews and customer sentiment
delta_report.json	What changed since the previous run

Also load **data/<competitor>/ci_report.json** if present for the last structured AI summary.

Always tell the user upfront: "Latest data is from [date] at [time], compared against [previous run date]."

STEP 2 — Extract Delta Signals

From **delta_report.json**, read **changed_pages**. For each changed page, apply the following filter logic:

Filter Out Noise — Skip changes that are only:

- Follower count increments (± 500 or less)
- Timestamps: 'Xm ago', 'Xh ago'
- Cookie consent banners or bot verification walls
- Generic pagination numbers
- PeerSpot global peer count changes

Flag as High-Signal — if added_lines contain any of:

- New blog post titles or article headlines
- Product names, feature names, or capability descriptions
- Pricing or packaging language
- Partnership, acquisition, or funding mentions
- Case study or customer story titles
- Analyst report mentions (IDC, Gartner, Forrester)
- Job posting volume changes (hiring signals)
- New taglines or homepage messaging changes
- Press release titles
- Event or launch announcements

For each high-signal change, record: the URL, the exact added line(s), the exact removed line(s) if relevant, and the source type (competitor website / social / analyst / review).

STEP 3 — Load CI Report Context

If **ci_report.json** exists, extract:

- Last AI-generated summary of the competitor
- Overall competitive positioning snapshot
- Any flagged strengths or weaknesses from the last full analysis

Use the CI report as background context — it represents the baseline understanding. The delta from Step 2 layers on top as 'what's new since then.'

If no CI report exists, rely on training knowledge of the competitor and the raw scraped content.

STEP 4 — Research High-Signal Changes

For each high-signal item identified in Step 2, take the appropriate research action:

Signal Type	Action
New blog post or press release title	Use WebFetch to retrieve the full article. Extract: core announcement, product names, customer names
New social post	Read full text from scraped content. Identify: campaign angle, vertical, customer reference, product
Analyst mention	Note the publication. Search for any publicly available summary or quote.
Website messaging change	Compare old and new lines directly. Characterize the strategic shift in 1-2 sentences.

Summarize each finding in 1-3 sentences of finished intel — never pass raw diff lines to the user.

STEP 5 — Deliver Structured Output

Deliver the response in the following exact format:

Header

■ Intel Brief: [Competitor Name]

Data from: [run date/time] | vs. previous run: [previous run date] | Sources: [X pages scraped]

What's New Since Last Run

For each high-signal item:

[Source type] > "[New content]" Intel: [1-2 sentence interpretation — what it means for Tricentis, which verticals or deals it affects]

Current Positioning Snapshot

- Core message right now: [homepage/social active push]
- Target buyer: [enterprise / developer / SMB / vertical]
- Key product being promoted: [name and angle]
- Analyst standing: [Gartner/Forrester if known]

Customer Sentiment

From PeerSpot:

- Praised for: [top 2-3 themes]
- Complained about: [top 2-3 themes]

AE Battle Notes ■■

Use in discovery:

- "[Question exposing their weakness]"
- "[Question exposing their weakness]"

Talk track for today:

"[1-2 sentence AE-ready statement based on what's new]"

Watch out for:

- [New claim, case study, or announcement the prospect may raise]

Data Quality Table

Source | Status

Competitor website | OK / Partial / Blocked

LinkedIn | OK / Login wall

X/Twitter | OK / Limited

YouTube RSS | OK / Error

Forrester | OK / Partial

PeerSpot | OK / Blocked

Last scraped: [date/time] — next run: [next Mon/Wed/Fri 8:30 AM Central]

STEP 6 — Offer Deep Dive

Always close every Skill 1 response with the following offer:

- Fetch and read the full text of any new blog post or press release
- Pull a full battle card for an upcoming deal
- Compare this competitor's current messaging against Tricentis positioning

This is a draft for review. Skill 2 (Ad-Hoc Research) and Skill 3 (Script Generator) logic drafts to follow.
